

Responsible AI Statement

This application is designed to assist users in identifying the provenance of digital media. A misprediction poses a risk of misinformation, either by mislabeling authentic content as synthetic or vice-versa. This tool is explicitly out of scope for high-stakes decision-making, including legal evidence verification or automated content moderation systems where absolute accuracy is required. We have implemented robust technical guardrails to maintain system integrity, including SSRF protections and DoS prevention, to ensure the tool cannot be weaponized. To manage model uncertainty, we expose raw confidence scores; we advise users to treat outputs near the 0.5 threshold as inconclusive and to perform manual verification. Furthermore, our privacy-first design, local browser inference, ensures user data is never transmitted or stored, eliminating third-party data collection risks.
